

# INK SEIZER TO CLEAN FOUNTAIN SOLUTION

***The Ink Seizer® is a nylon mesh bag filled with a special material that will absorb and remove ink from fountain solution***

## **Ink Seizer Jr.**

We also offer the Ink Seizer Jr.® that was developed for use in the fountain solution trays of presses with recirculating dampening systems. Like the Ink Seizer used in recirculating tanks, this smaller-sized product (2.75x4.75"/7x21cm) removes emulsified and misted ink from the fountain solution.

Using either Ink Seizer assures ultra-clean fountain solution to maximize profits due to cleaner printing, longer-lasting fountain solution and less downtime.

## **How the Ink Seizer Works**

Place the Ink Seizer in the recirculating tank; the special absorbent material in the Ink Seizer will cause the ink to be attracted to it as it floats on the surface of the fountain solution.

The Ink Seizer keeps the press recirculating tank cleaner by preventing ink from migrating through the dampening system, thereby extending the life of the fountain solution.

The Ink Seizer is designed so that it will not absorb water, gum or other important fountain solution ingredients. Also, it will not affect the composition of the fountain solution.

## **Standard Ink Seizer**

The 4x9.5"/10x24cm Ink Seizer will absorb many times its weight in ink and will not sink in the tank. When totally saturated, the Ink Seizer should be removed and then dried prior to disposal.
